

HACKATHON 2026 • EIRGRID + CSO OPEN DATA

GridSense

Forecast where Ireland's load will peak.
Route renewables there first.

SECTION 01 / 07

The problem

Wind gets switched off while the grid says no.

The problem

Technical details

THE PROBLEM

Wind gets switched off. Then gas runs the peak.

37.6%

island wind + solar share, 12 months

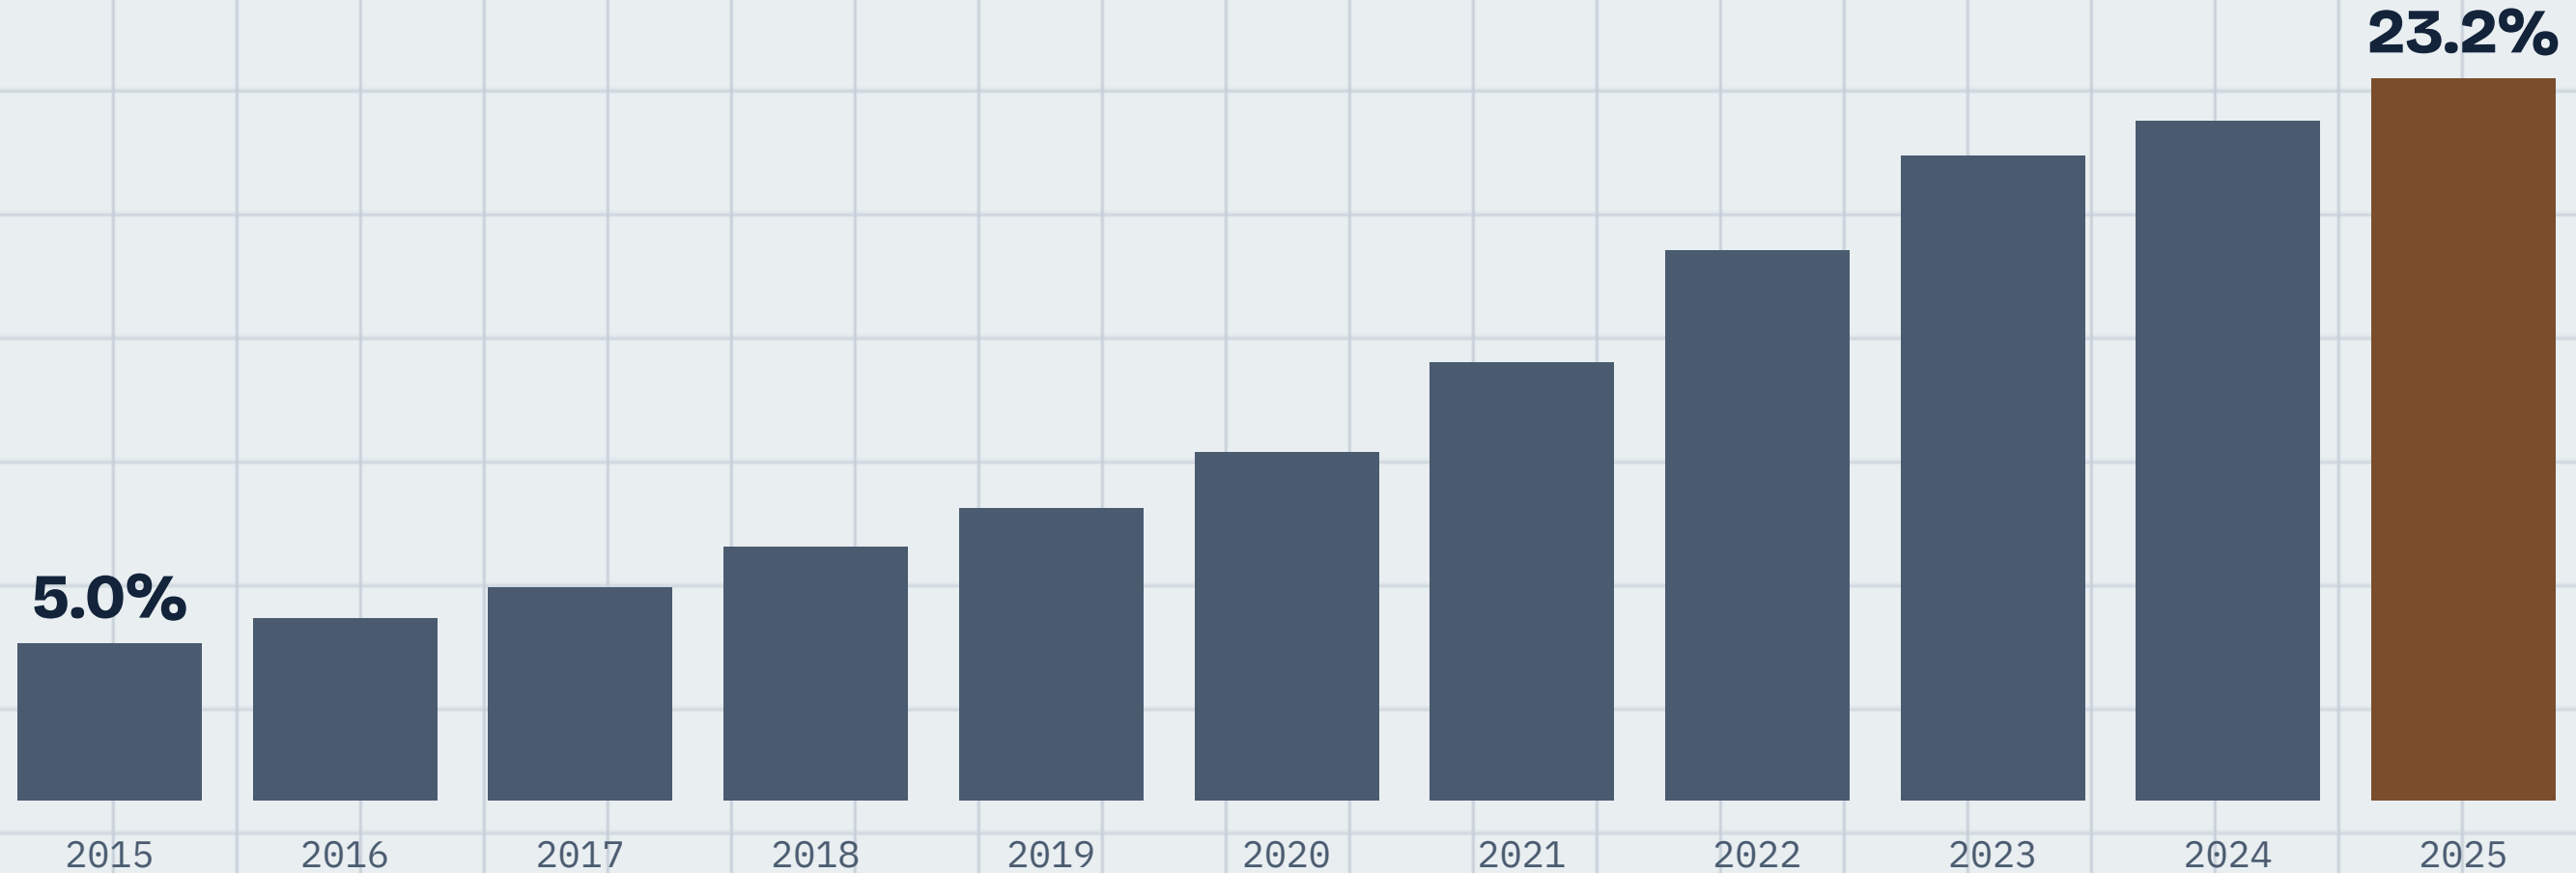

EirGrid Smart Grid Dashboard, ROI hourly, 29-30 Sep 2026. Switched-off wind estimated as wind forecast - actual when the grid is $\geq 60\%$ renewable.

THE PROBLEM

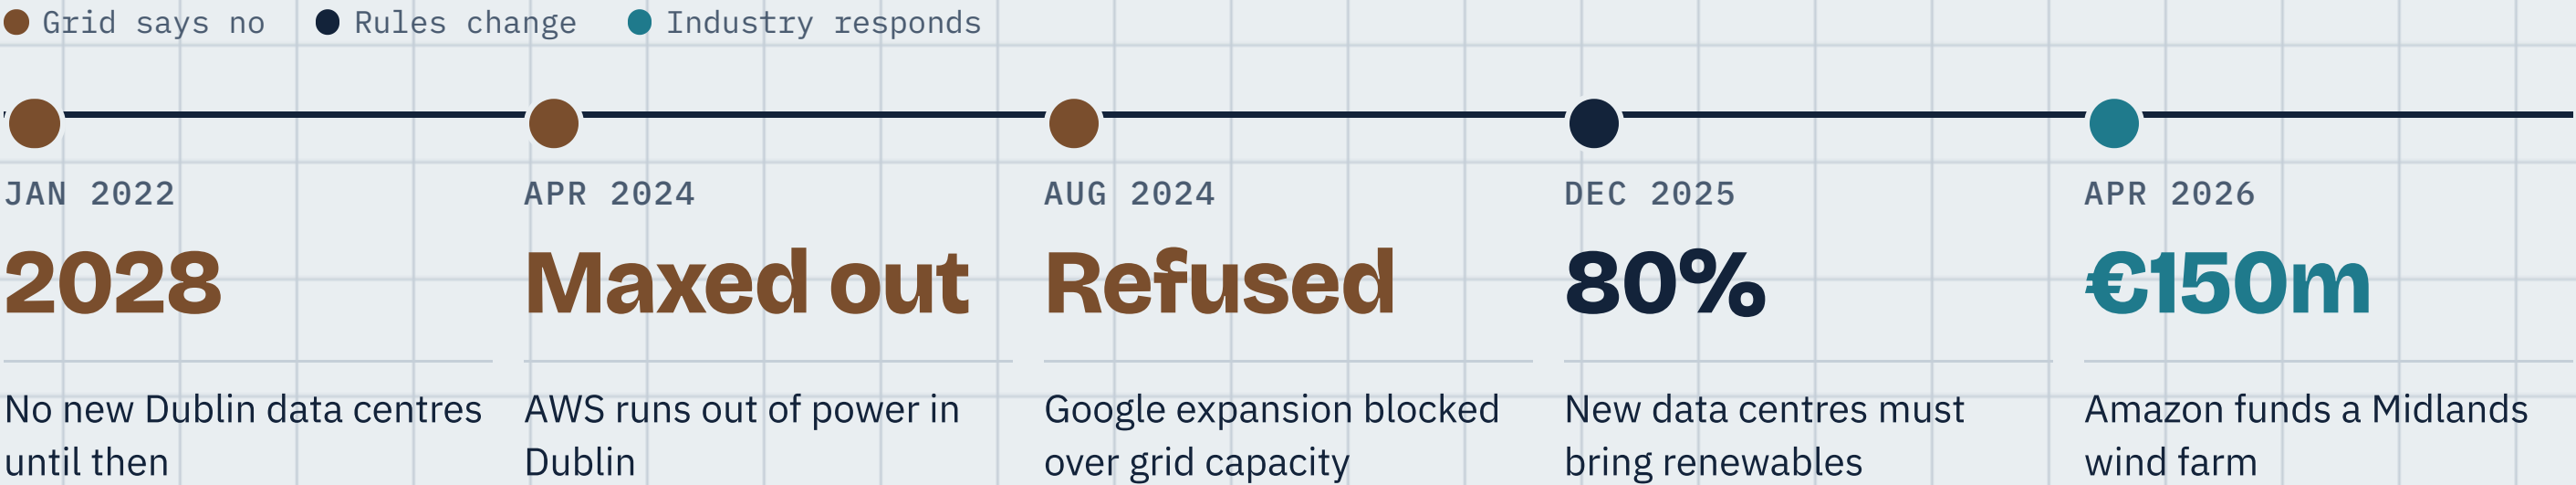

Data centres now use **23.2%** of the Republic's electricity.

6.2×
more than in 2015

CSO MEC02: data-centre share of ROI metered electricity, by year, 2015–2025.

The grid said no. The rules changed.

Where GridSense fits: hour-by-hour, per-area proof of renewable use.

Sources: RTÉ / DCD, Jan 2022 • The Register via DCD, 10 Apr 2024 • Techerati, Sep 2026 • CRU decision via William Fry, 15 Dec 2025 • Irish Examiner, 27 Apr 2026

SECTION 02 / 07

What GridSense does

Forecast the peak. Route wind to it first.

The problem

What GridSense does

Who it's for

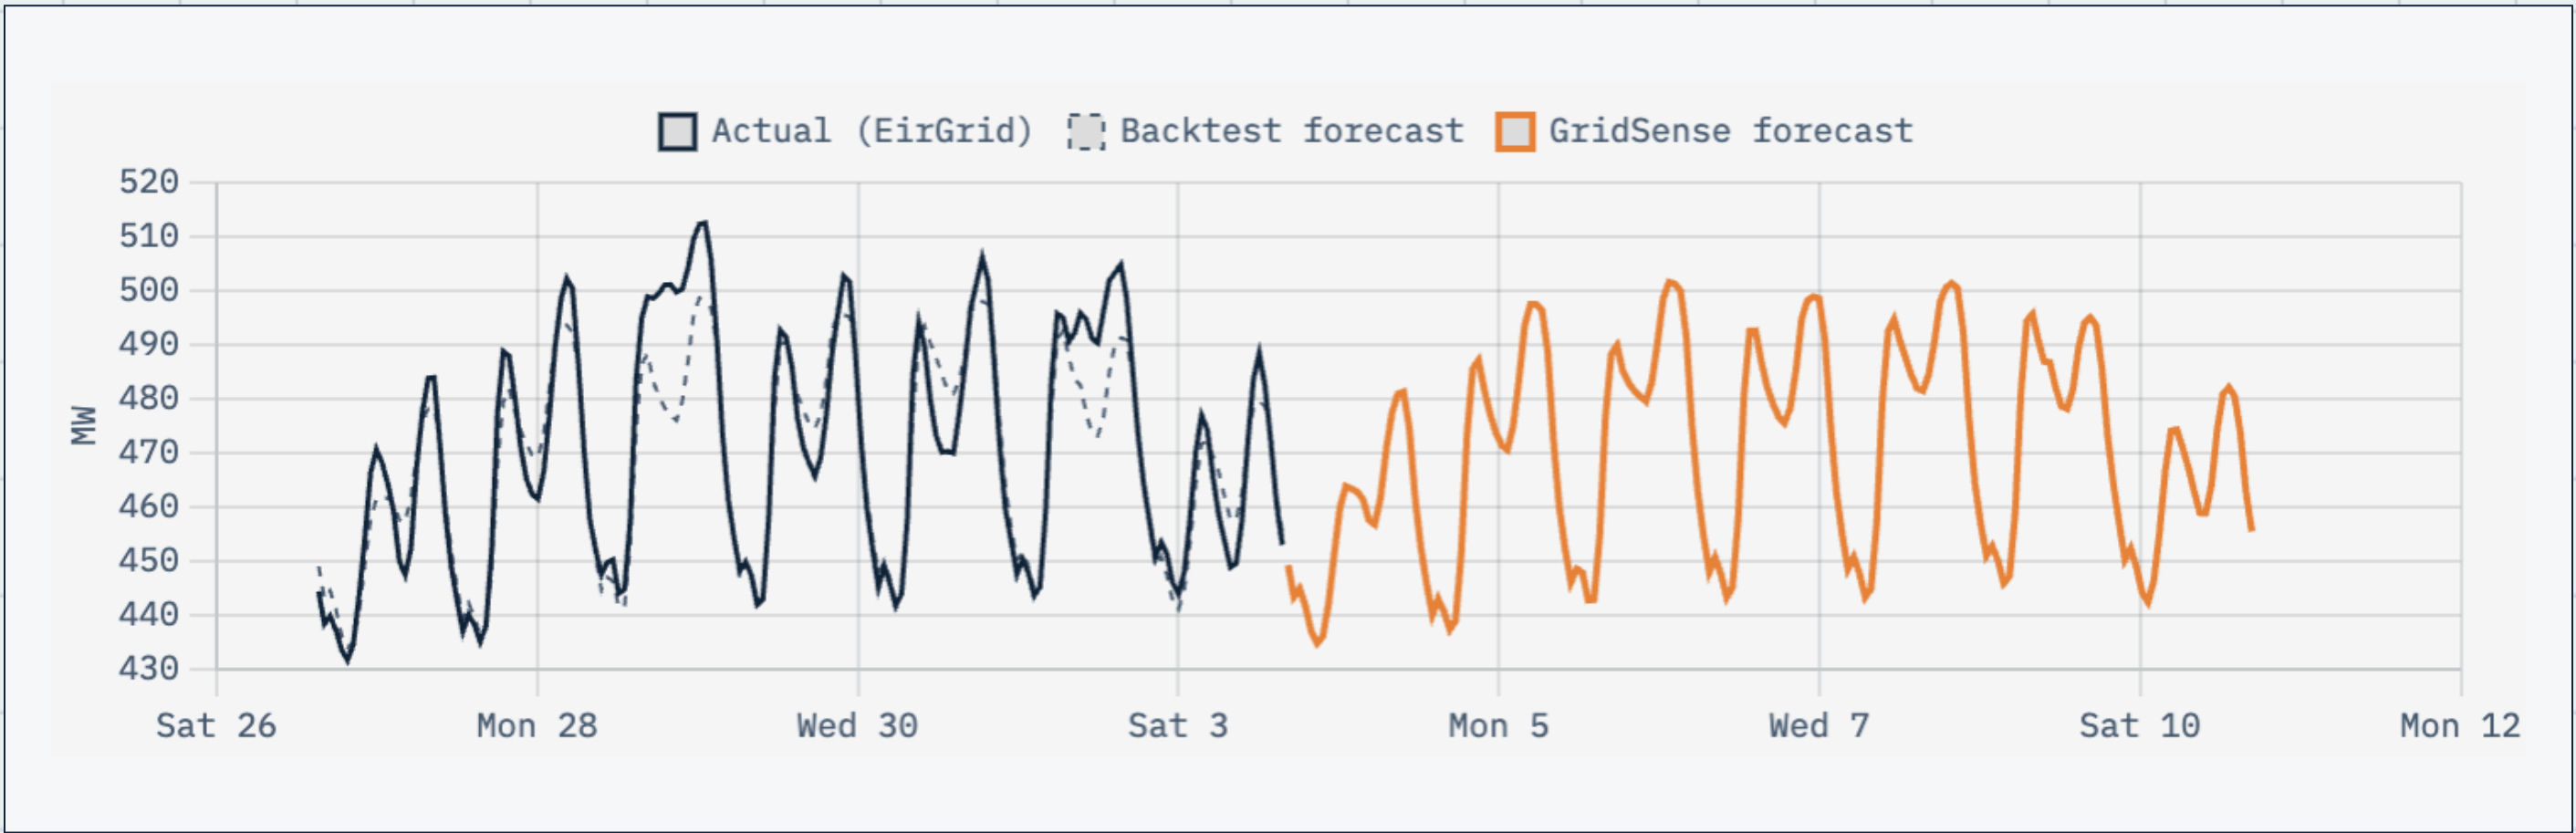

Impact

Live demo

What's next

Technical details

We forecast every area's peak, a week ahead.

2.8%

backtest error, ROI

45

areas, hourly, 7 days

696 MW

Dublin City, Tue 18:00

Then we book spare wind for the biggest peak.

Cork County → Dublin City

485 MWh

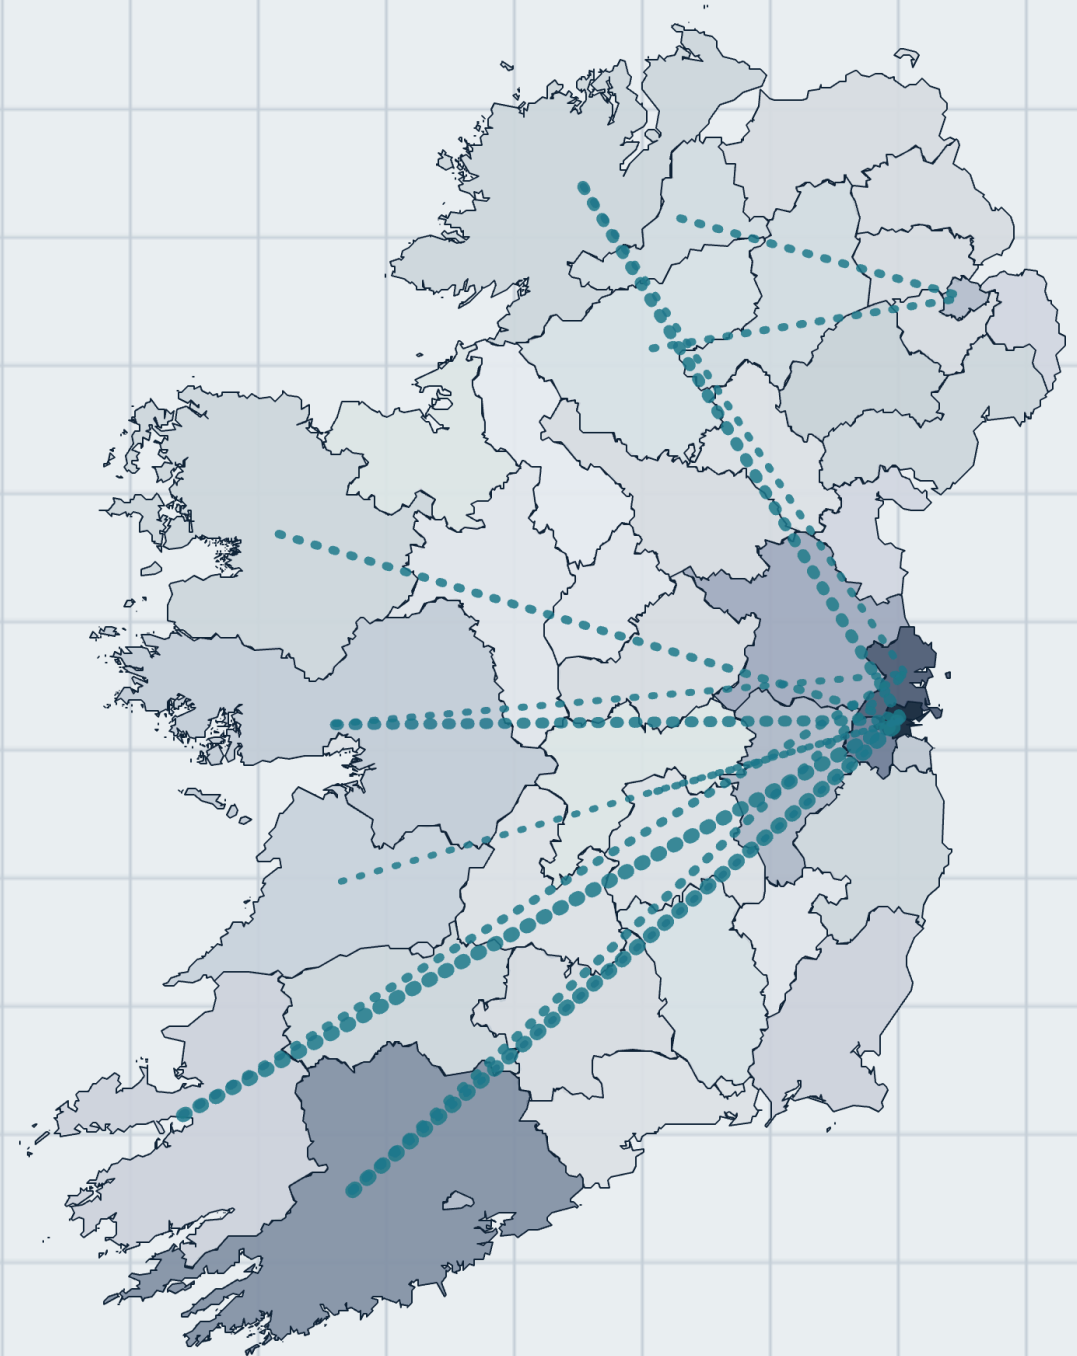

Kerry → Dublin City

461 MWh

Donegal → Dublin City

364 MWh

12.8 GWh planned this week

And we prove the cut, area by area.

-9.3 kt CO₂

AVOIDED WITH GRIDSENSE • 12 MONTHS

~~670.3 kt~~ → **661.0 kt** **-1.4%**

Fingal gets **82.3 GWh** more wind, delivered in its forecast peak hours, when the grid would otherwise burn gas. Wind + solar share goes from **37.6%** to **39.6%**. The load stays the same and nothing changes on site.

Fingal, Ireland's data-centre hub • 12 months • live dashboard

SECTION 03 / 07

Who it's for

Data centres, government, new industry,
households.

The problem

What's next

Technical details

Same workload. More wind behind it.

1,845 MW

forecast peak, this week

+299 GWh

recovered wind at peak hours

-33.8 kt

CO₂ cut, from 2.36 Mt

What a data centre gets.

24/7

Hourly-matched carbon-free
evidence

Scope 2

Location-based figures, per site

80%

An answer to the CRU rule

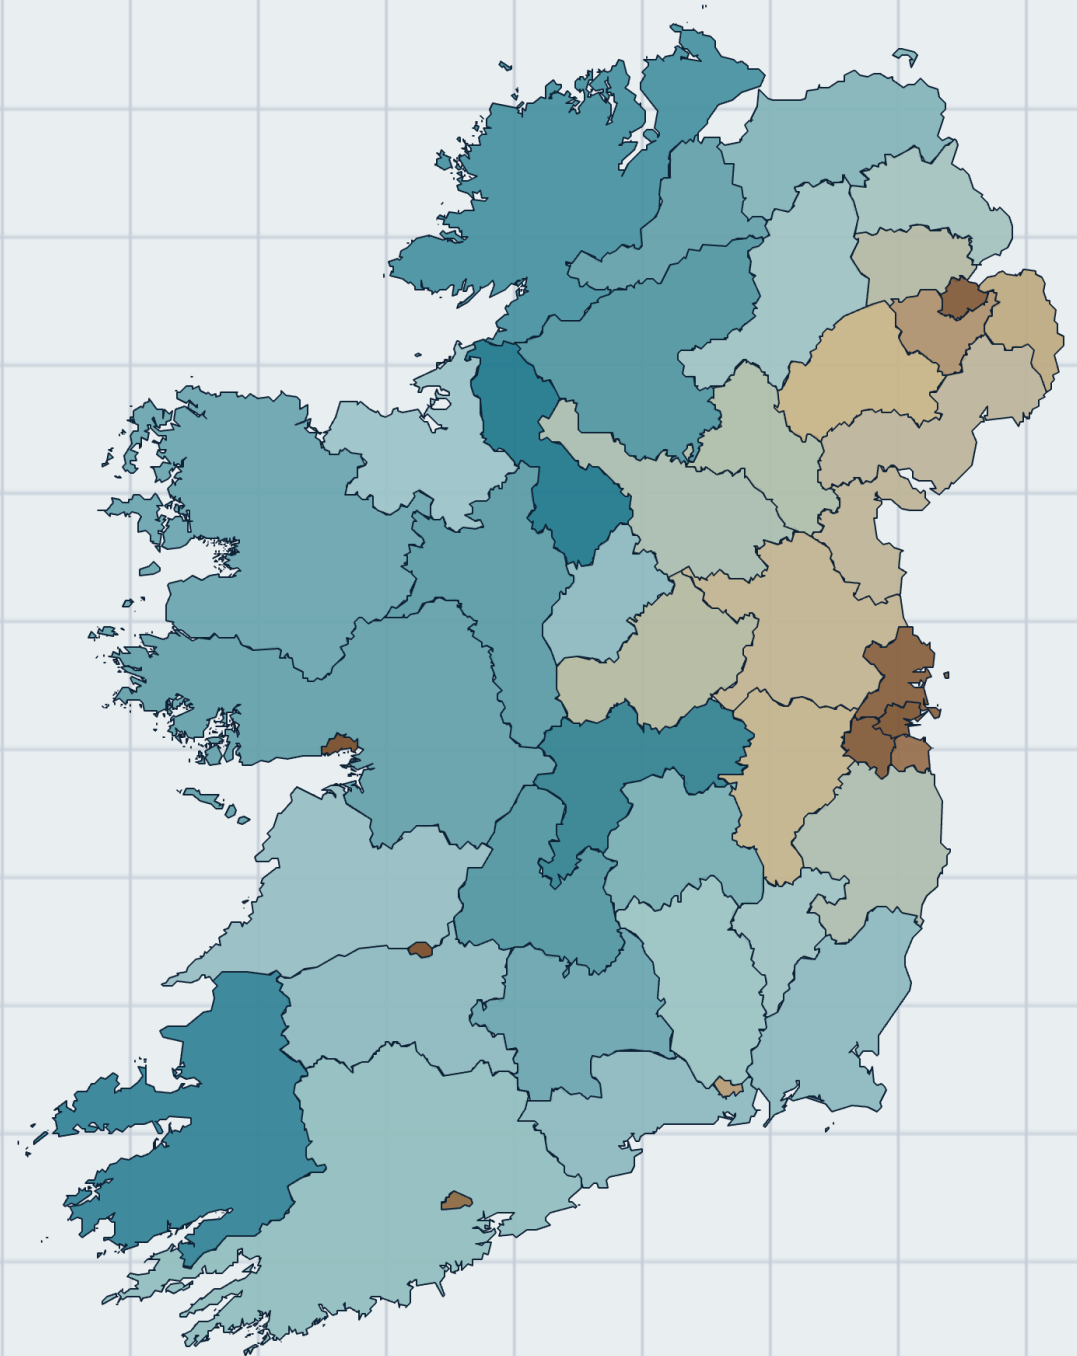

No change to workloads or SLAs.

The west makes the wind. Dublin uses it.

 **Leitrim 1.9× • Kerry 1.6×**
generate more than they use

 **Dublin ~0.01×**
imports almost all of it

Local generation ÷ use, last 3 months. Where the next
wind farm and cable should go.

Build where the wind is.

2.5x

Leitrim makes 2.5x the renewables it uses

0.09x

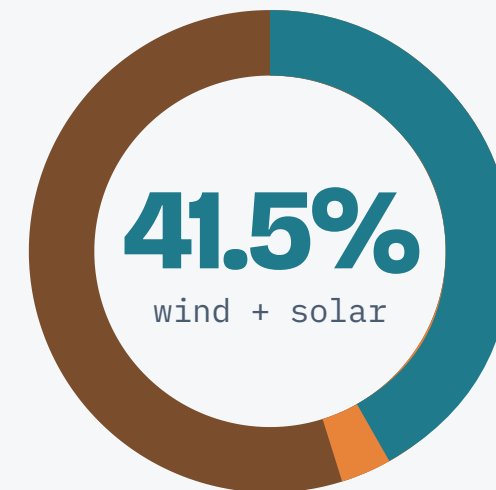

Meath and Kildare: the data-centre corridor

Site near the surplus, not the congestion

"How much of my
power was
renewable?"

DUBLIN CITY • LAST MONTH

44.8% with GridSense

120 kg CO₂ per resident

SECTION 04 / 07

Impact

Twelve months of real EirGrid data.

What's next

Technical details

Three things get us live.

Node-level wind data

EirGrid + SONI

A data-centre pilot

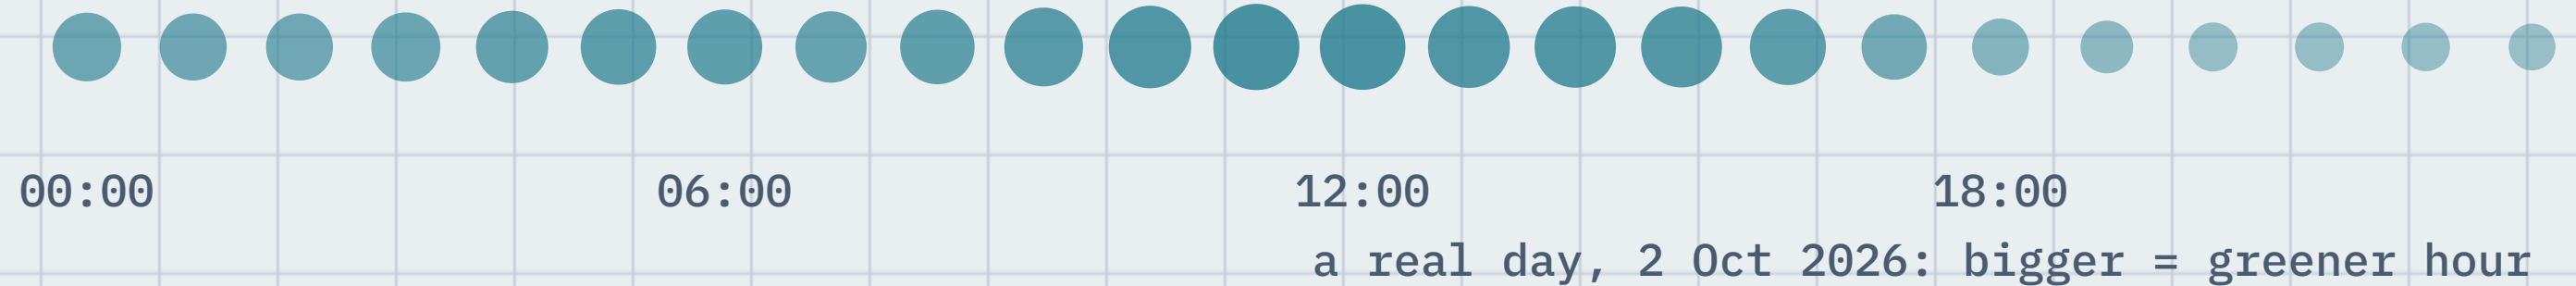

Fingal or Meath

A policy sponsor

forecast-led grid scheduling

Green-hour tokens.

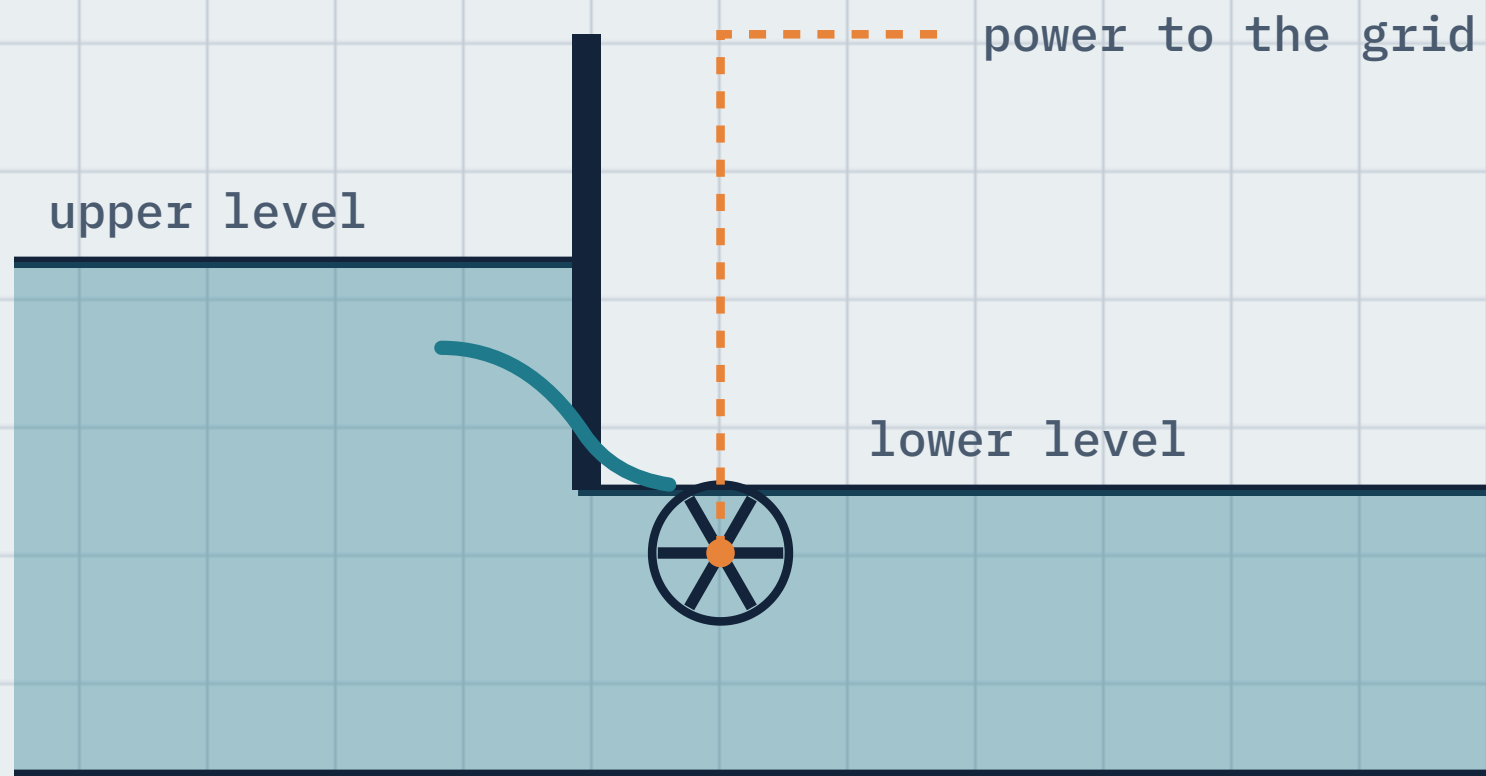

— Fund renewables, earn priority green hours

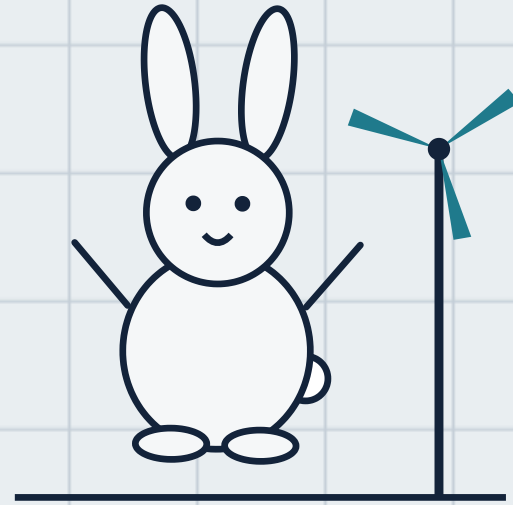

— A cap per company: no cornering the wind

— Every token is an auditable hourly record

Micro-turbines on Ireland's canals.

- Turbines at locks and weirs, where water drops
- Steady output, day and night
- GridSense picks the sites

Thank you.

This bunny's moves are powered by wind
that would otherwise have been switched off.
Questions?

Proudly deployed on good old **Heroku**. Yeah, it's not dead. Nostalgic?

APPENDIX

Technical details

CSO MEC03

use by county

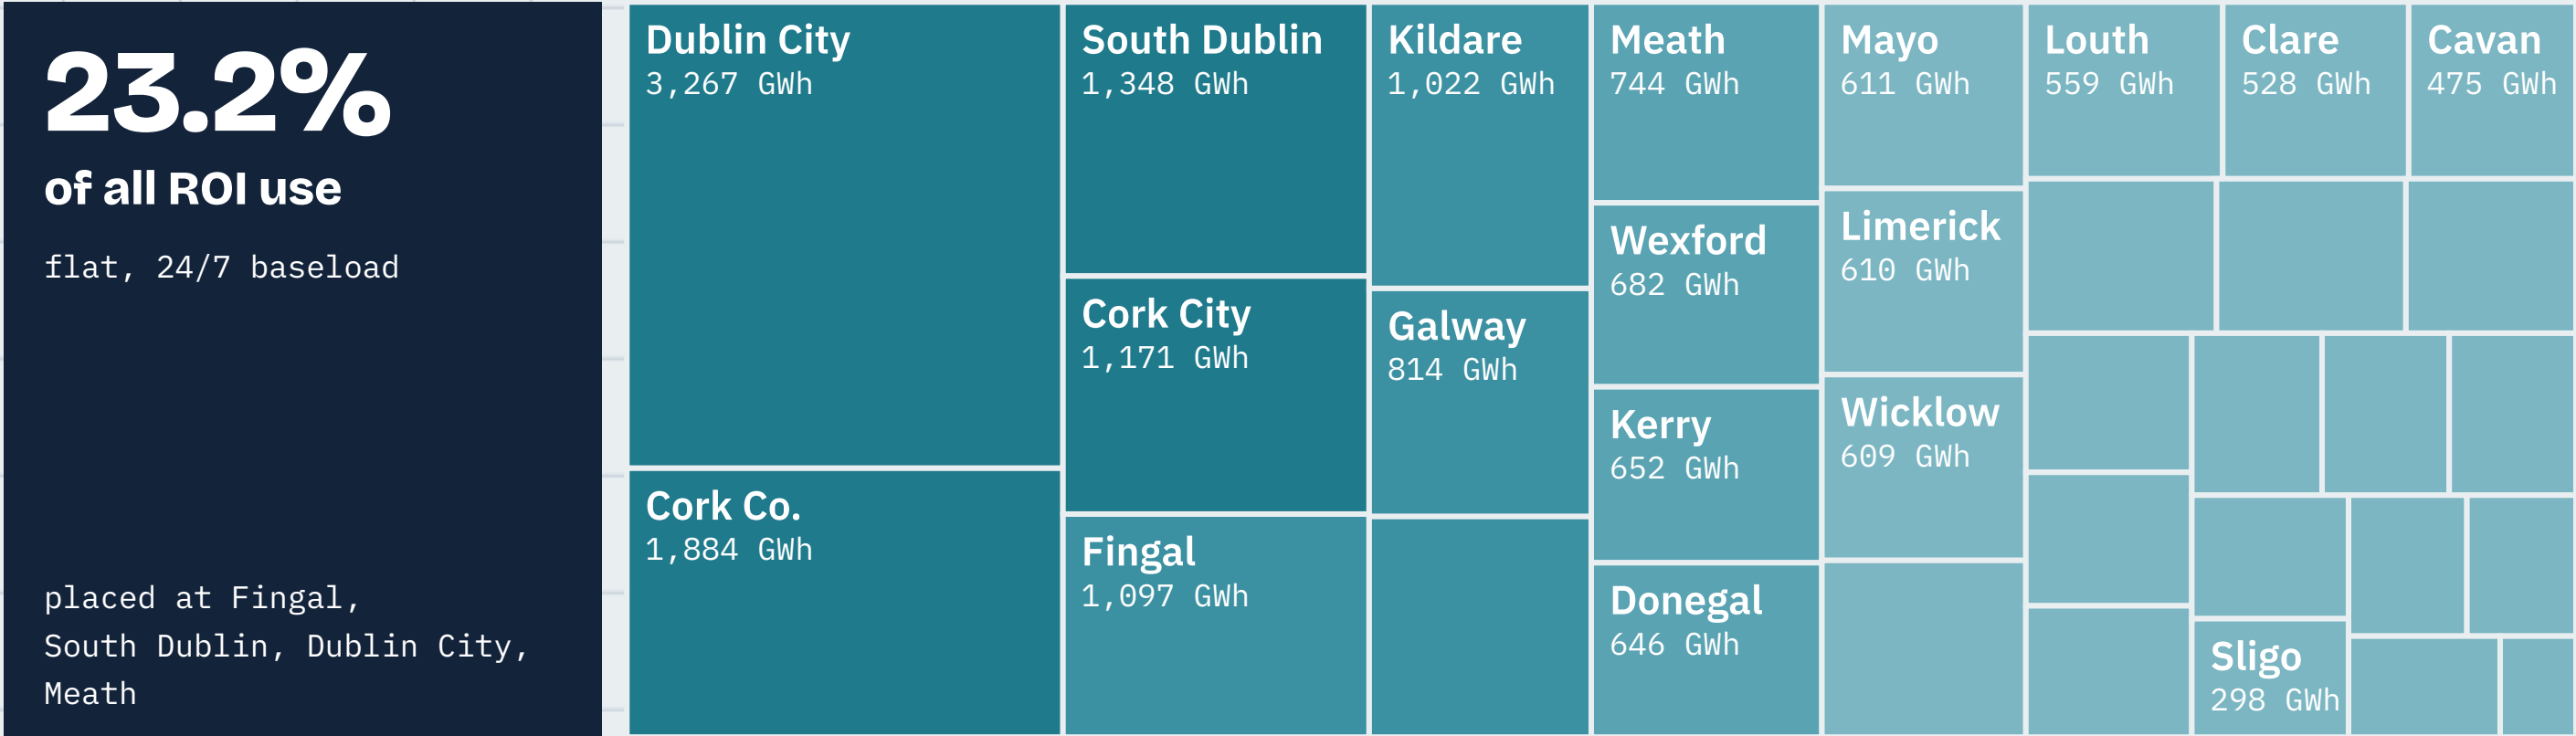

Five steps from open data to a routing plan.

Step 2: share the national load out to 45 areas.

CSO MEC02 · DATA CENTRES CSO MEC03 · METERED USE PER COUNTY + DUBLIN POSTCODE, 2025

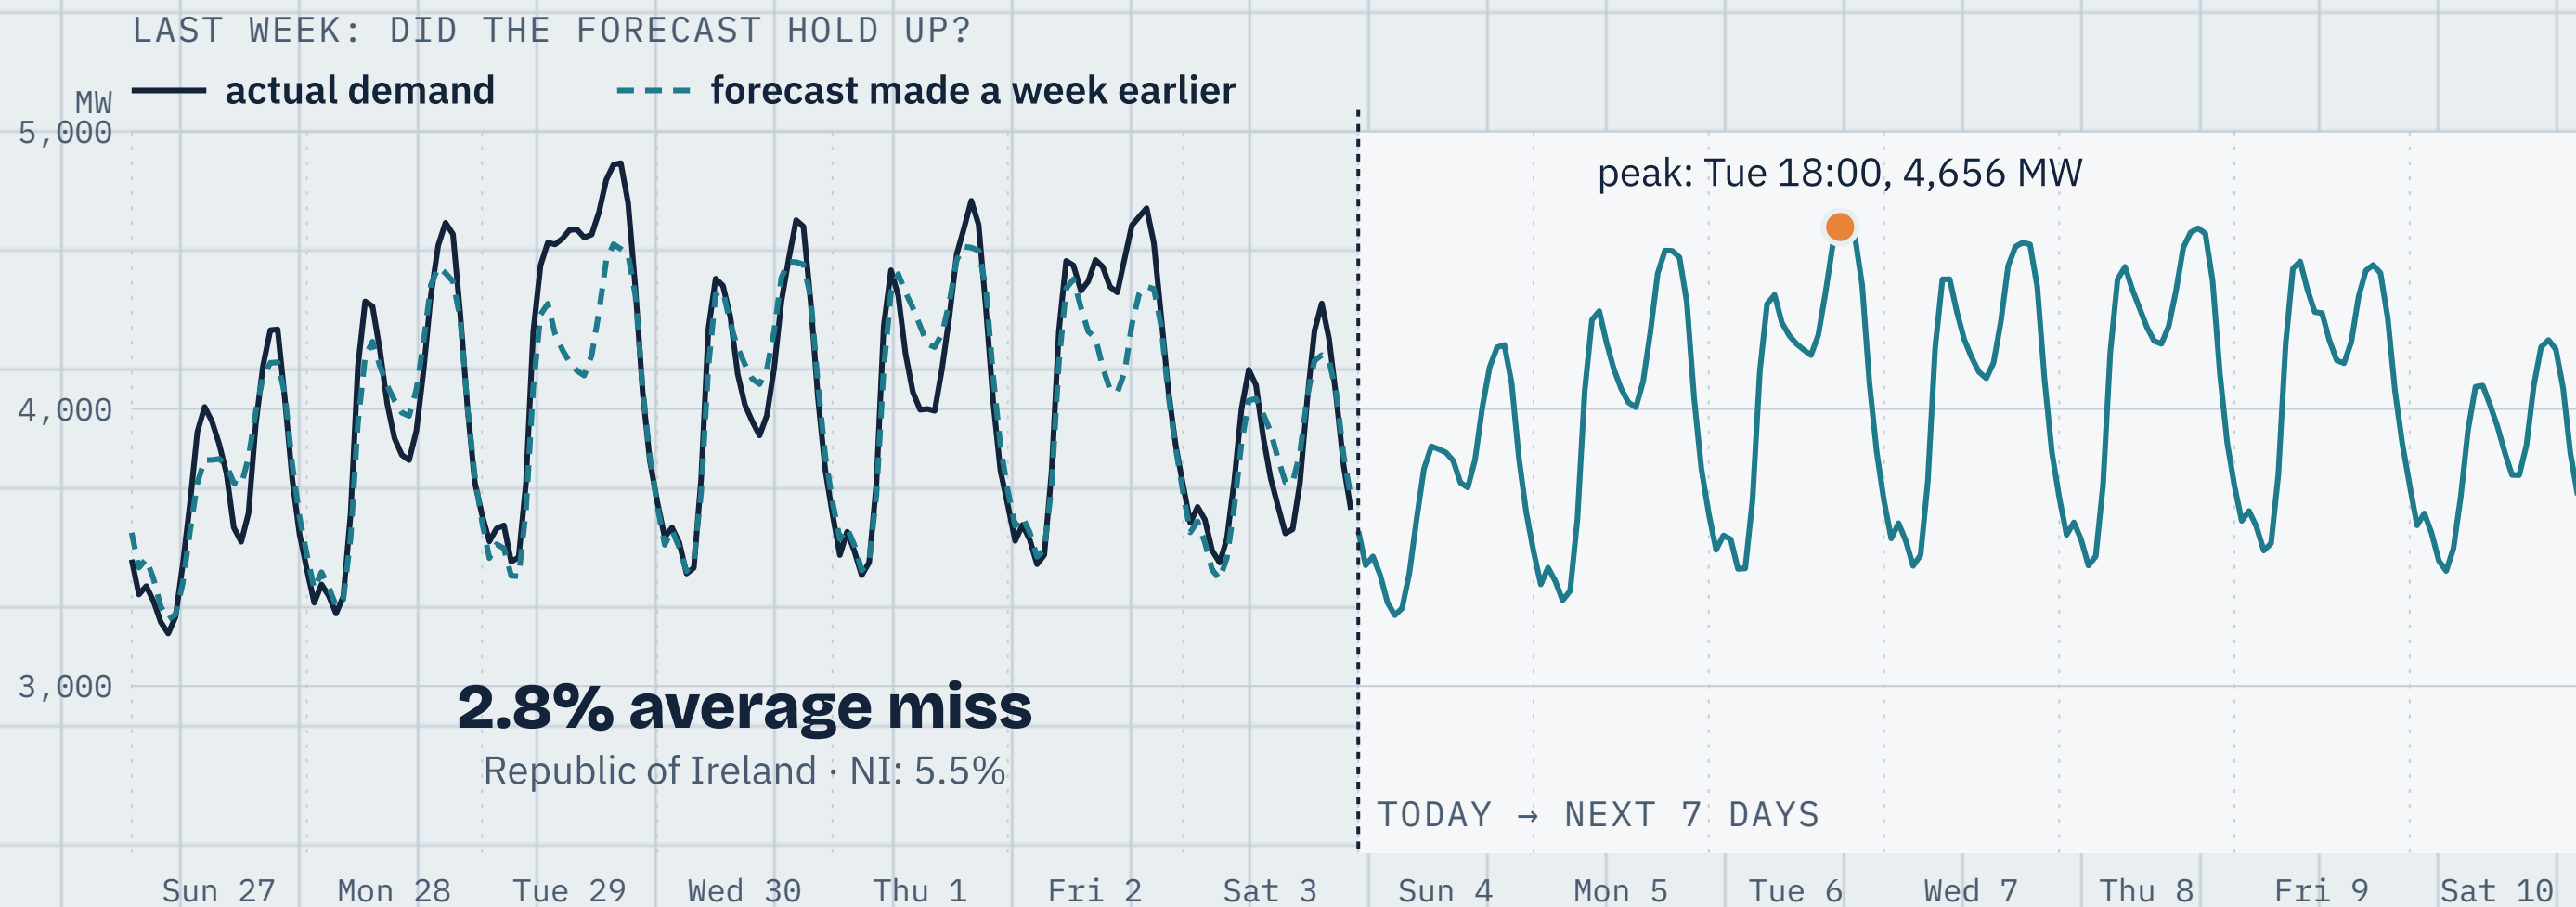

tile size = electricity really used

+ NI: 11 districts, by population

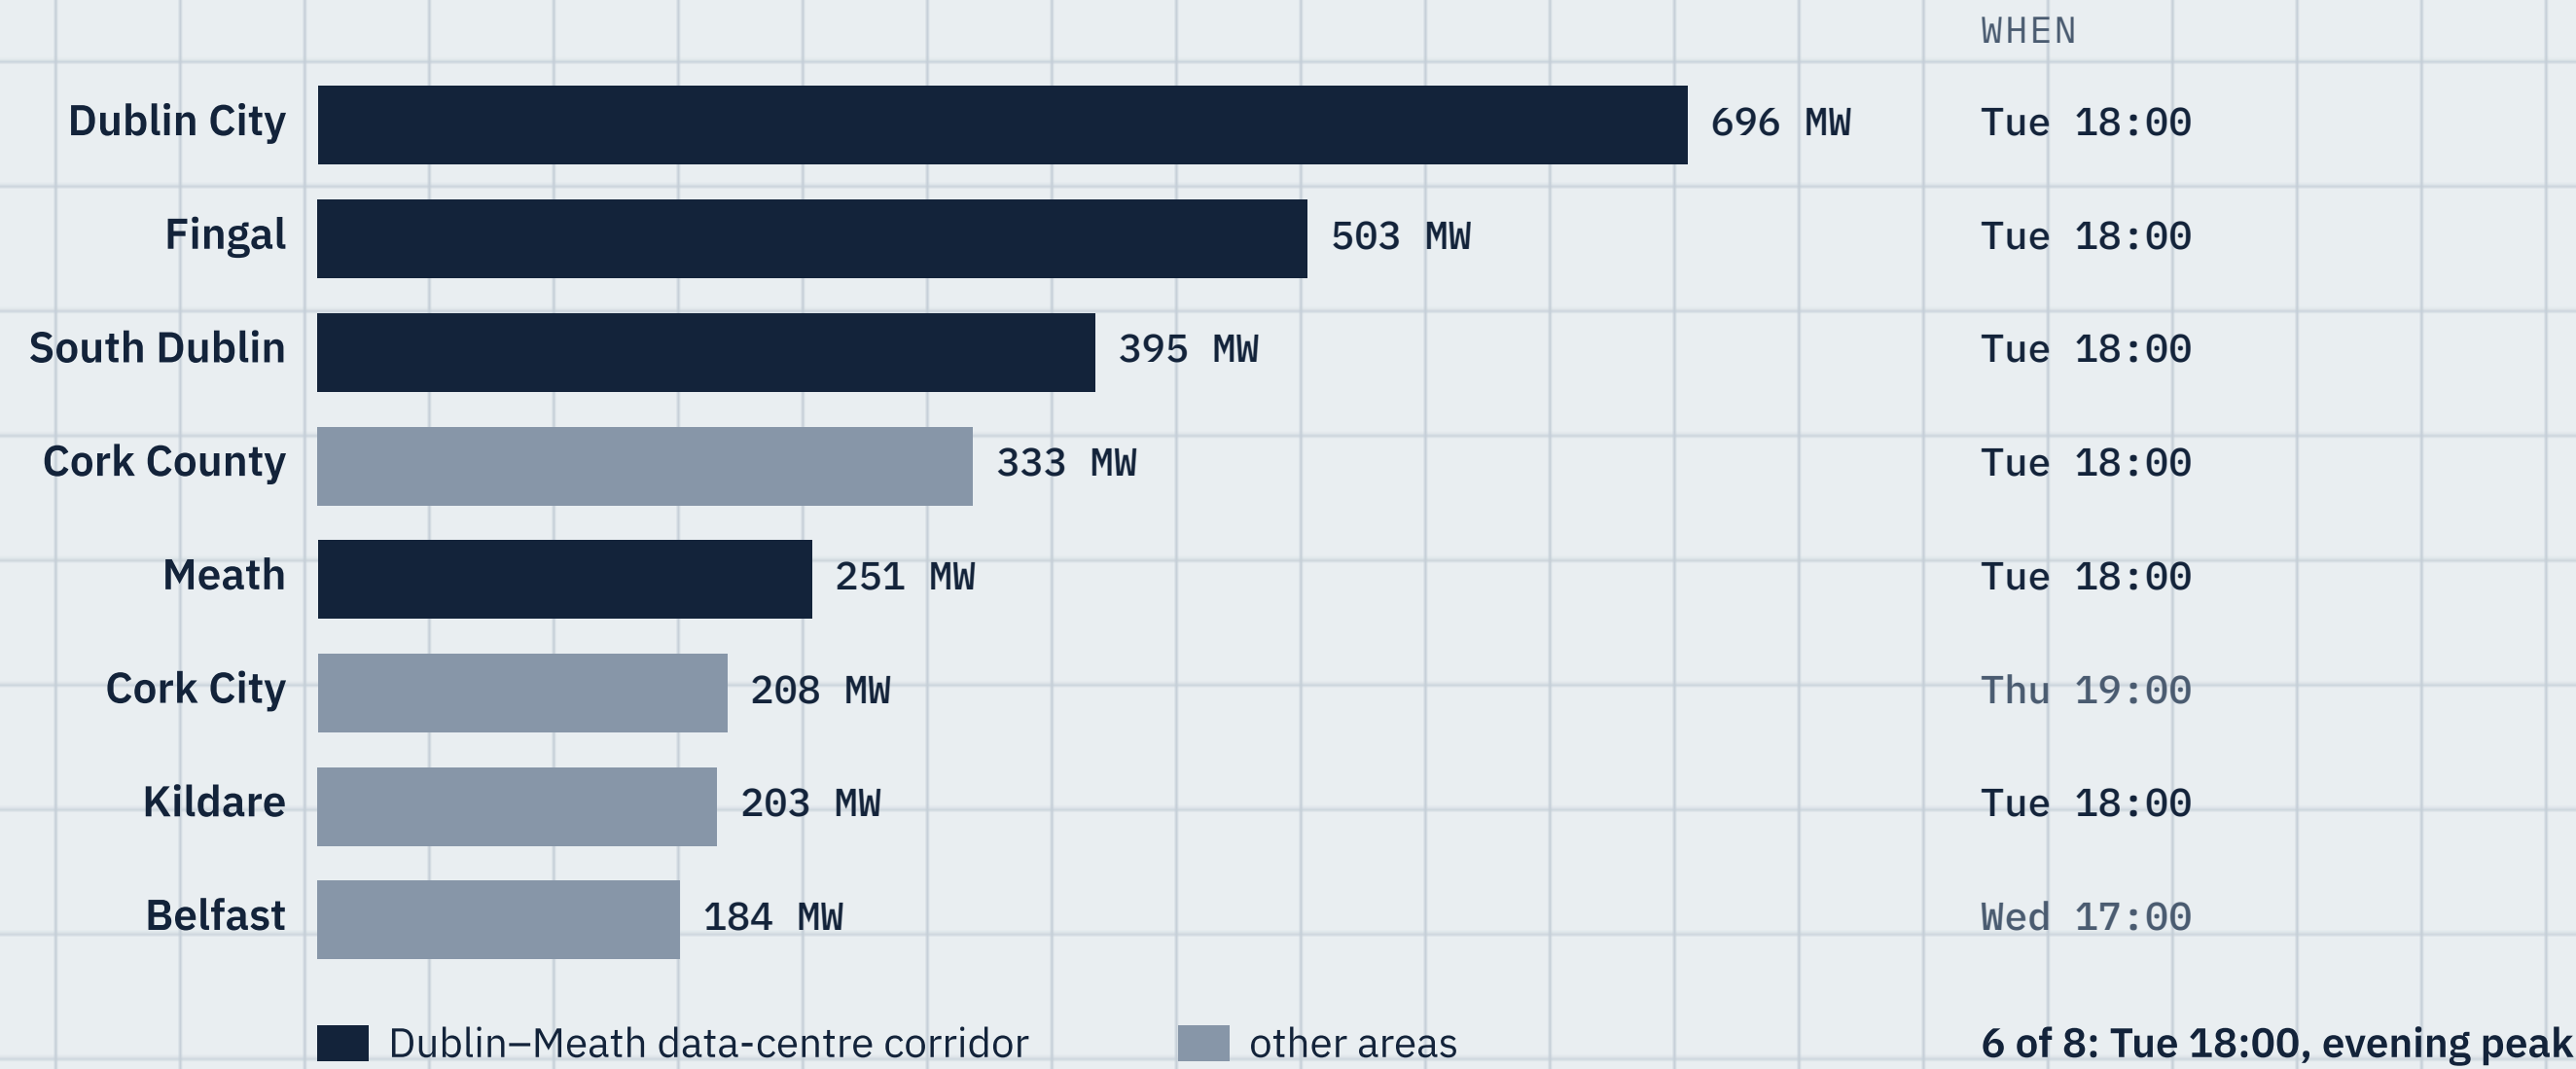

✓ adds up to EirGrid demand, ±1%

Step 3: forecast every hour of next week.

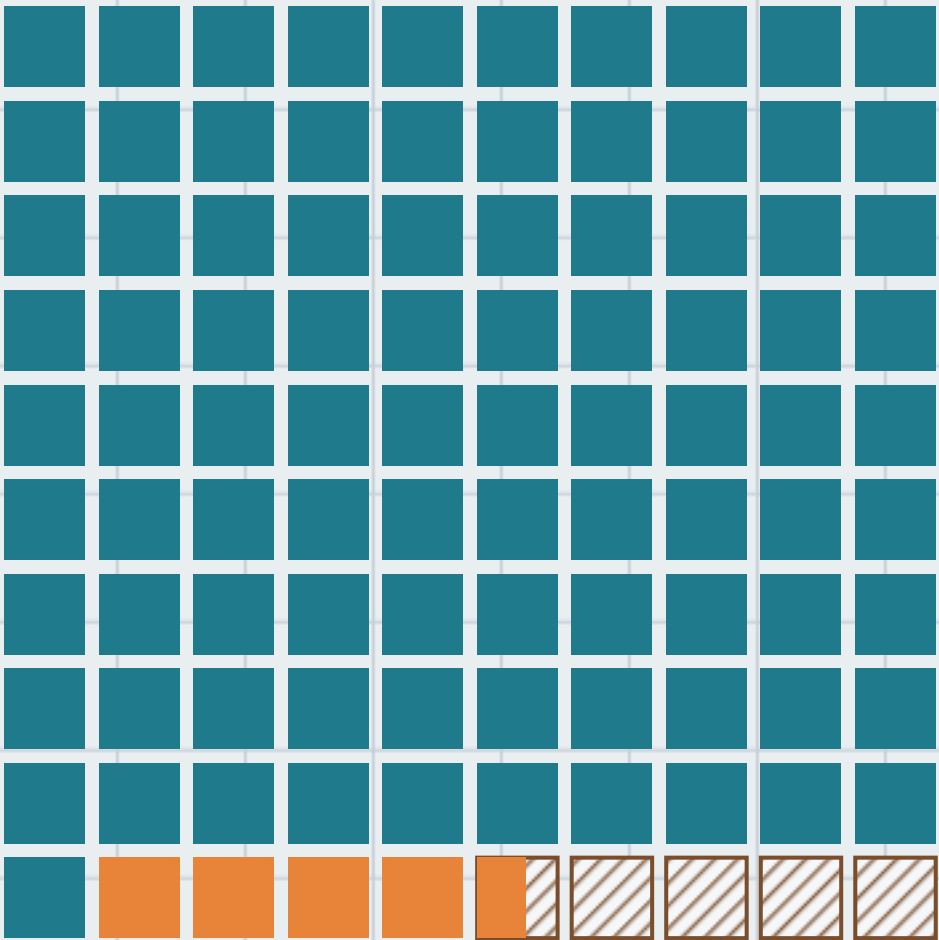

how: average of the same hour over the last 8 weeks × last week's trend

Step 4: rank where next week's peaks hit.

The biggest peaks get first call on spare wind →

Step 5a: find the wind that gets switched off.

every square = 1% of ROI wind, 12 months

91% reaches customers

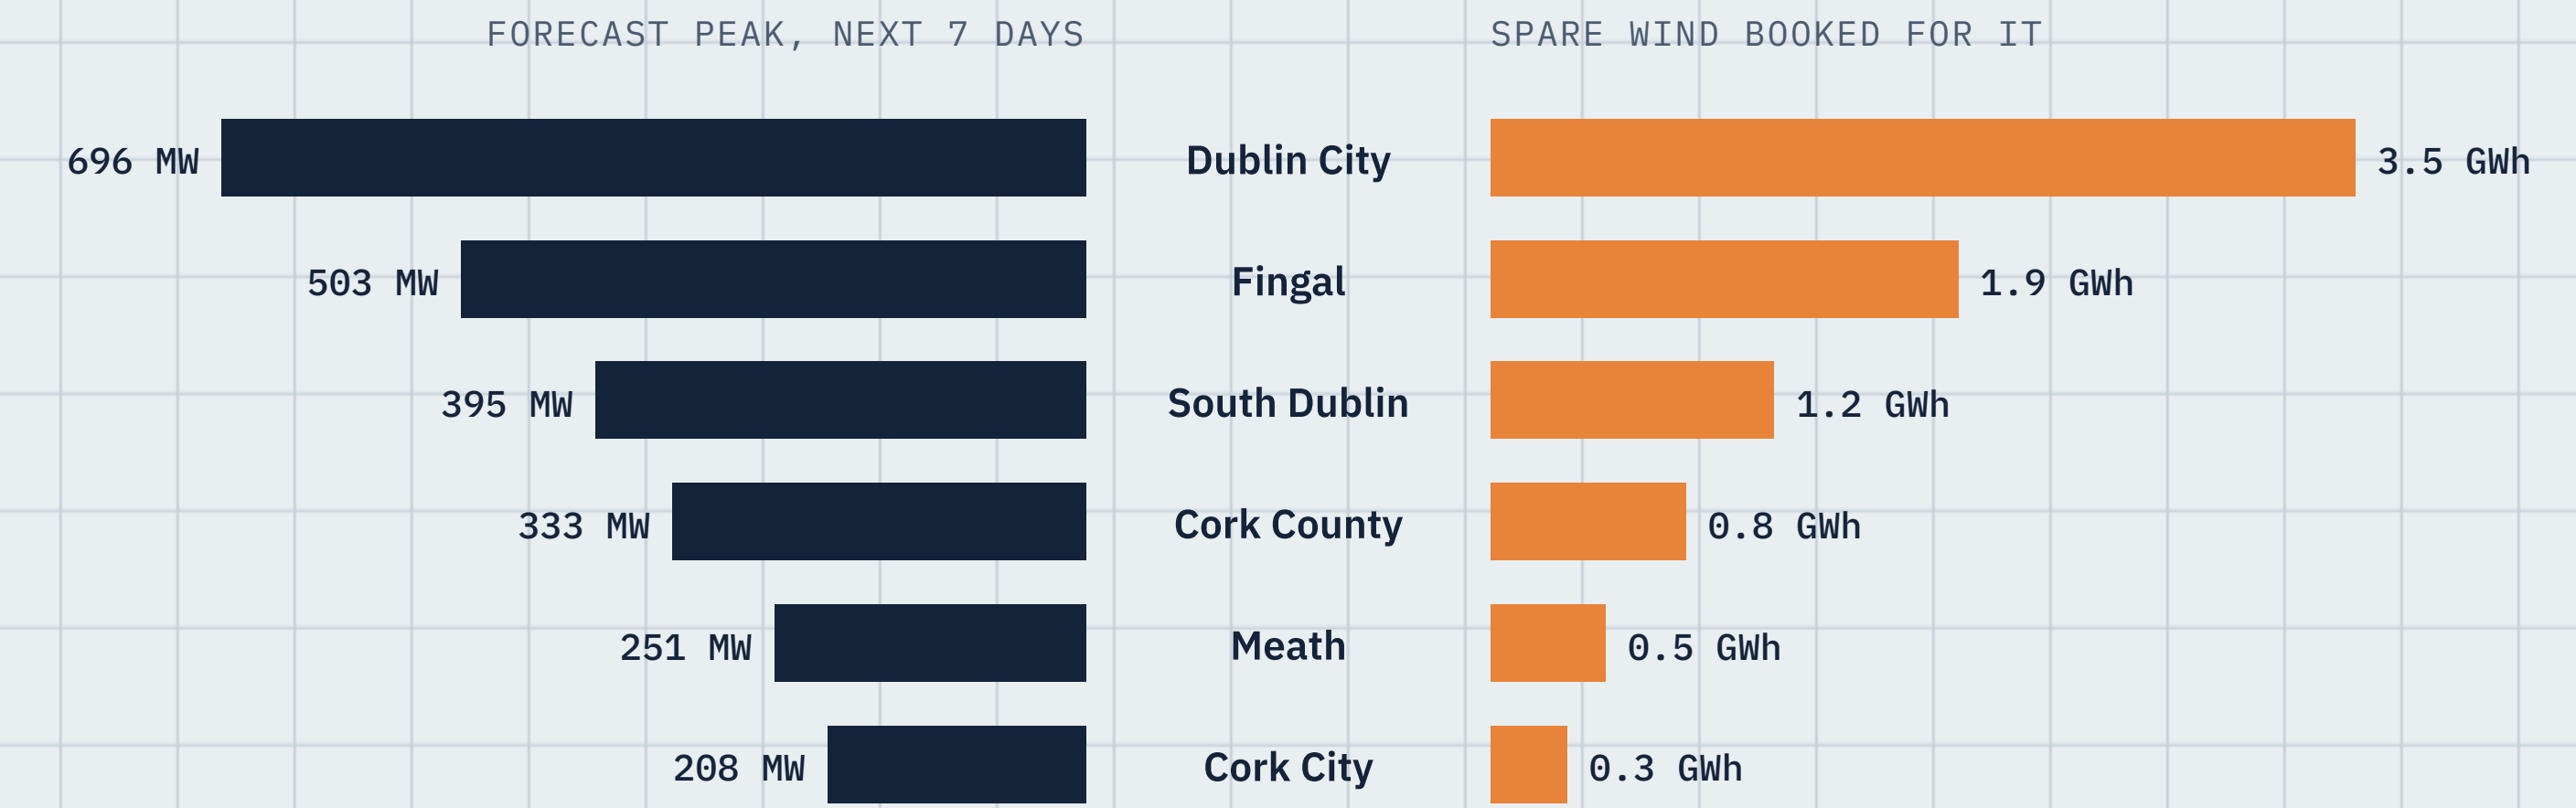

wind that the grid could absorb

9.2% dispatched down

wind farms told to stop: forecast – actual, when the grid is $\geq 60\%$ renewable
EirGrid reports $\sim 10\%$ ✓

Half of it ($\approx 4.6\%$) is grid congestion.
GridSense schedules that part into forecast peaks.

Step 5b: share it out, biggest peaks first.

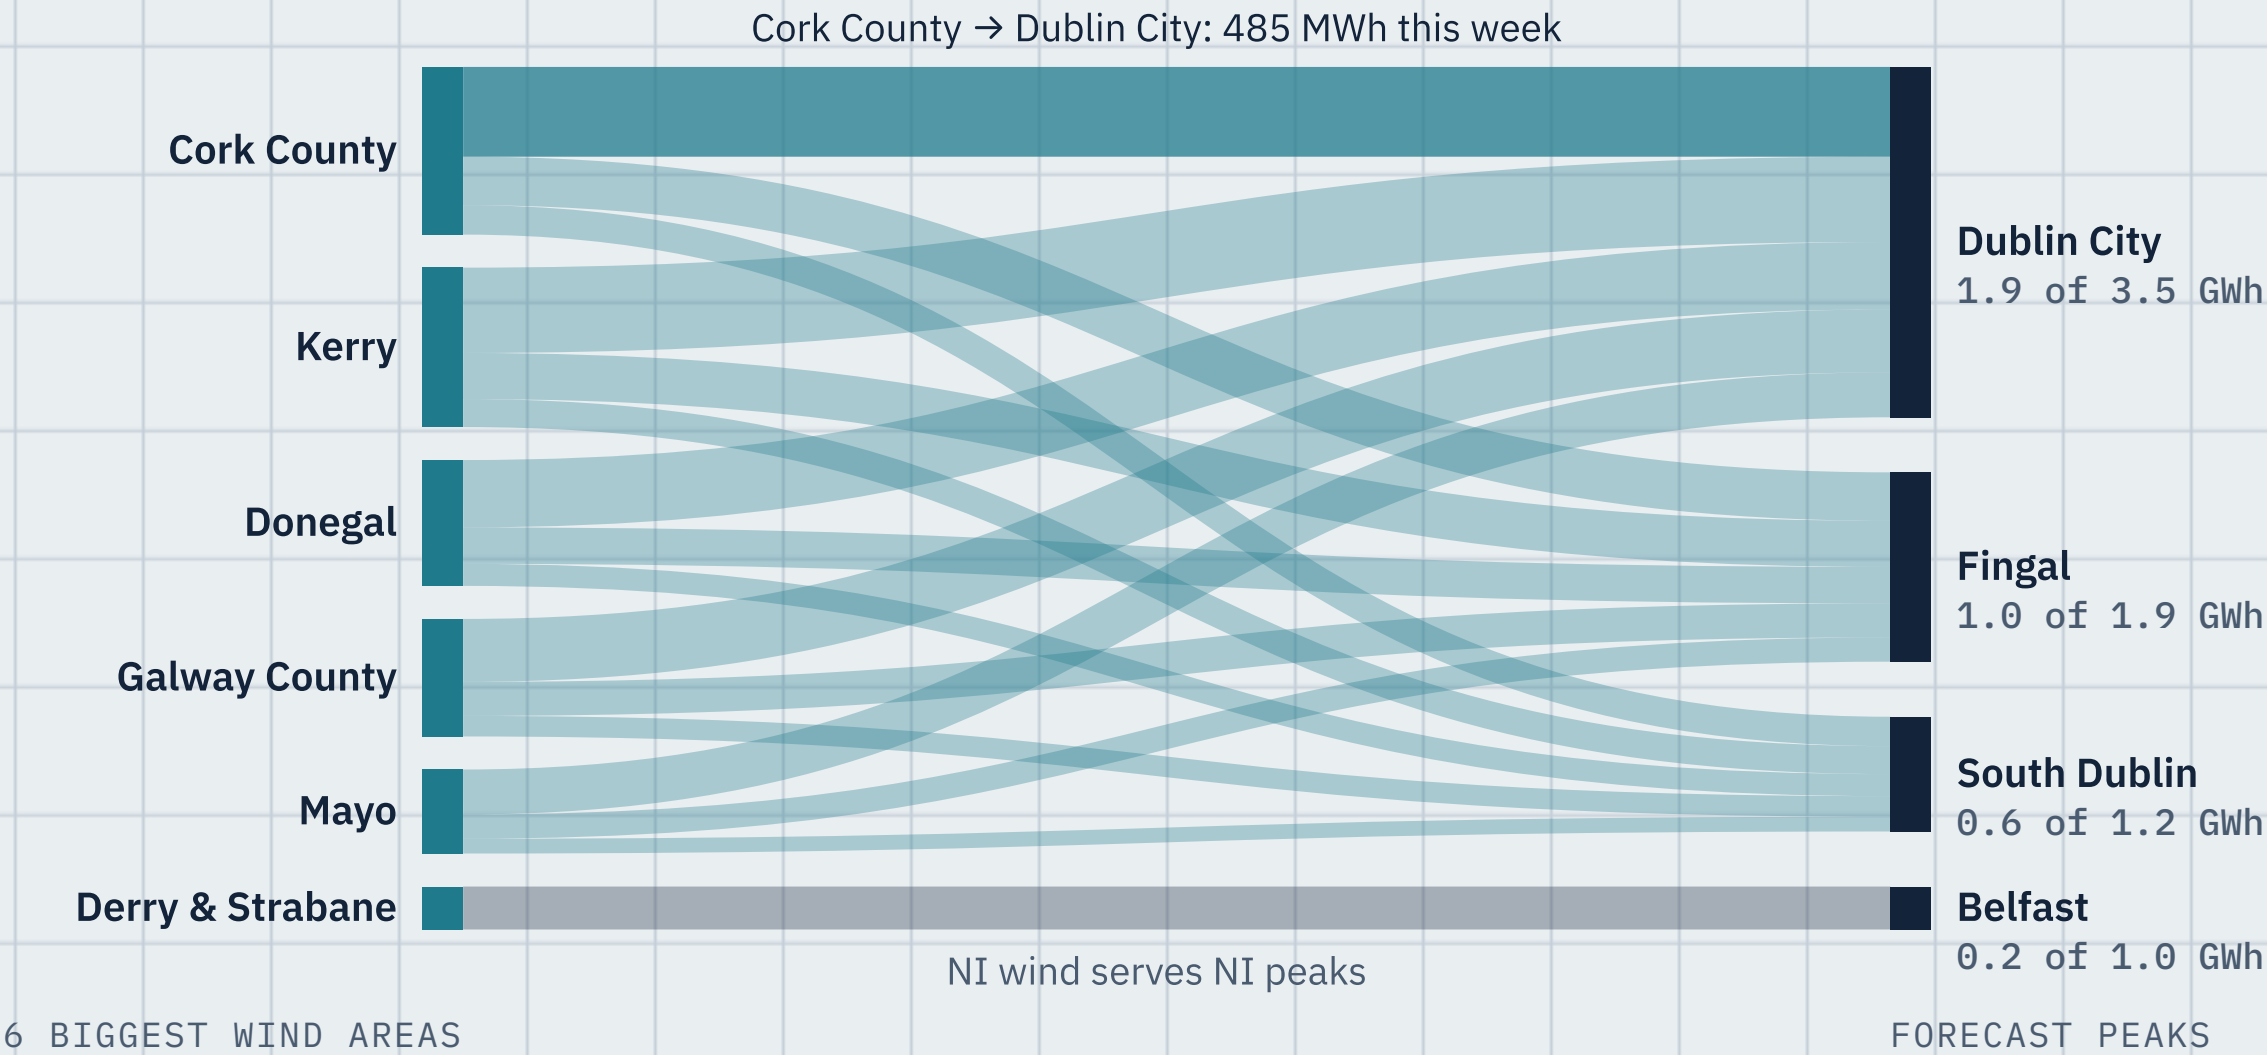

Share grows with peak²: Dublin City's peak is 1.4× Fingal's, so it gets 1.8× the wind. Everyone gets some.

into each day's 6 highest forecast hours

capped at the area's gas-fired load in those hours

leftover re-shared

Step 5c: every flow has a source and a number.

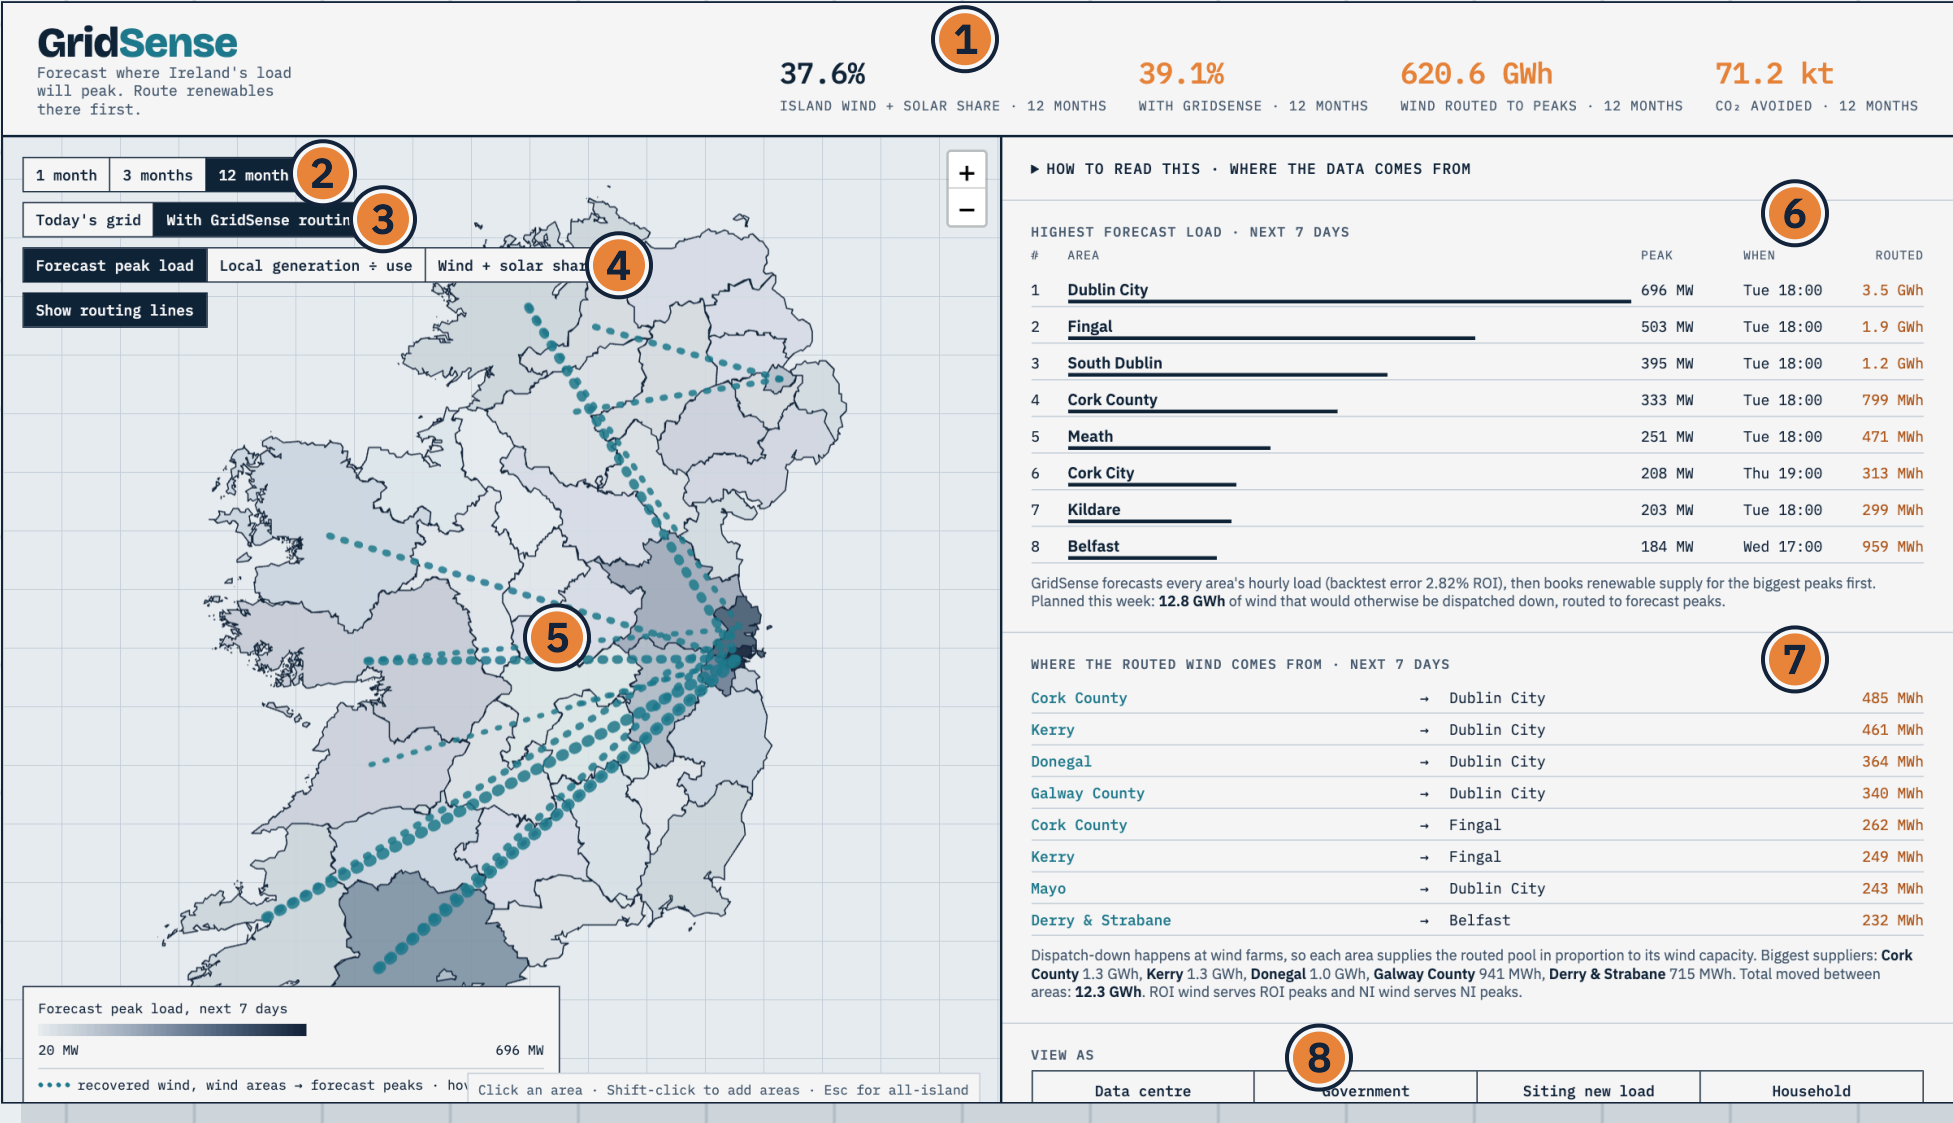

thicker = more energy, next 7 days

each wind area supplies in line with its wind capacity

12.8 GWh planned

One screen: where peaks hit, where wind comes from.

Click any area: see what GridSense saves there.
